

Newer drugs needed for doctor's bag

Michael Woodhead

Many of the PBS emergency medicines supplied for the doctor's bag are no longer best practice and should be replaced or withdrawn, an emergency specialist says

Benzylpenicillin is no longer the drug of choice for meningococcal disease because of increasing resistance and should be replaced with ceftriaxone or cefotaxime, says Dr John Holmes, Senior Staff Specialist of Emergency Medicine at the Sunshine Coast Area Hospitals.

Writing in the *Australian Prescriber* ([link](#)) Dr Holmes says midazolam should be used in status

Some drugs in the doctor's bag needs replacing, says Dr Holmes

epilepticus rather than diazepam, which is highly irritant to veins, has unpredictable bioavailability when administered intramuscularly and is rarely used rectally.

Other drugs that should be replaced include haloperidol and chlorpromazine for psychosis, where olanzapine is a better option, says Dr Holmes, and frusemide in acute pulmonary

oedema, where first-line therapy is preload reduction with nitrates.

Review of PBS emergency drug supplies ([link](#)) should also remove obsolete drugs such as procaine penicillin, terbutaline injection and tramadol for analgesia, which has been associated with life-threatening angioneurotic oedema and also has potentially serious interactions with SSRIs, he suggests.

Likewise, the antiarrhythmic drugs lignocaine and verapamil have no first-line role in cardiac arrest outside hospital "where the highest priority is basic life support, in particular effective chest compressions," says Dr Holmes.

Rural classification changes "arbitrary", says government

Gemma Collins

The rural classification system is "working well" according to the Federal health department, which says making changes for specific locations would be "arbitrary".

After a barrage of criticism from doctors over the current ASGC-RA system, the Department of Health and Ageing concedes that "boundary issues" are not uncommon but says a review of the system last year proved it is "working well".

"There is a commitment to ensuring the integrity of the ASGC-RA by not undermining the

system through making arbitrary changes for specific locations", it says in a submission to the Senate inquiry into Affecting the Supply of Health Services and Medical Professionals in Rural Areas.

([link](#))

Meanwhile in a submission to the inquiry, President of Rural Doctors Association of Australia Dr Paul Mara raises concerns that Medicare Locals could have a detrimental impact on rural GPs, particularly with after-hours care.

He says that unless Medicare Locals are efficient, effective and transparent, it could lead to "valuable health dollars being

wasted", with the health gap widening between people in rural and remote areas compared to those in metropolitan areas, and the GP rural workforce being "disheartened and discouraged".

He raises concerns that the withdrawal of the PIP afterhours incentive could demotivate GPs and lead them to walk away from providing afterhours services.

Meanwhile the RACGP calls for Medicare Locals to make rural and remote health a priority otherwise their success in improving rural health is "doubtful".

Repeat of 1918 flu pandemic unlikely, Diggers data suggests

Michael Woodhead

The high death rates seen during the 1918 influenza pandemic were due to unique circumstances and are unlikely to be repeated with current flu strains, according to an Australian researcher.

Dr Dennis Shanks of the Australian Army Malaria Research Institute at Enoggera, Queensland says data from Australian army soldiers and army doctors may

explain why most deaths in the 1918 pandemic were in young adults and attributable to secondary bacterial infections.

Writing in *Emerging Infectious Diseases* ([link](#)), he says that in 1918 the young adult cohort had been left more susceptible to secondary bacterial infections and death because of prior exposure to an A strain of influenza, which actually increased the inflammatory toxic responses and risk of bacterial

infection.

He also notes that soldiers with longer service, and army medical and nursing staff, had lower mortality rates, because they had been exposed to a much wider range of flu virus strains and pathogens. He concludes that in the modern era, the general population will have much greater exposure to different virus strains and will thus be less susceptible to infection.

Your say

GPs get mixed report card from Productivity Commission [\(link\)](#)

The report seems to fit the old adage of "he who pays the piper, calls the tune".

It would seem the Productivity Commission has fallen into a common error in assuming cost is the effective gap, whereas the government compensates

the patient acting as the insurer thus the whole cost of the visit should be taken into account. By thinking about the difference between bulk-billing and direct billing the patients then the government compensation is completely bypassed, not commented on and not thought about.

If the Commission is concerned that the cost is a problem putting people off from seeing the GP, imagine how put off the patient must be in seeing a specialist!

Dr Phil

Midwives and doctors differ in their pain relief choice [\(link\)](#)

I wonder whether the study differentiated between midwives who have had babies themselves and those who hadn't been through childbirth.

Likewise, whether the obstetrician was male or female and had also experience with the birth process.

I would suggest from my experience that a health professional's recommendation would be coloured by their personal experience no matter how hard we try to be objective. Sorry I am not paying \$30 to read the paper as the link is to just to the abstract.

Dr Mark Raines

"Fantasy" Medicare fees, says AMA [\(link\)](#)

Patient fee gaps are like speeding tickets and can be a good thing. They are there to warn people to look after their health before it gets more expensive. Sometimes money is the only thing they will take notice of. A practice always has the discretion to bulk bill, it

is a choice. Some patients make it a point to say they can't afford it while they spend on the same day \$200 on one weeks shopping that includes alcohol, smokes and fatty foods.

They are more prepared to pay for something that can kill them than something that can save their lives. Financial health literacy education that the man on the street can relate to is the real answer. Seriously it is a question of priority as opposed to affordability. It is a good opportunity to get people to start taking ownership of their health. Gaps gives them some skin in the game.
